```
CC (RKIKI), bradykinin receptor BZ (BDKRBZ), anglotensin converting enzyme CC (ACE2) or protease inhibitor 4 (P14), comprising at least one CC polymorphic position. Also included are (1) a probe that hybridises to a CC polymorphic position as provided in the detailed summary of single CC nucleotide polymorphisms comprising additional 5 and 3 flanking genomic CC sequence; (2) analysing (M1) at least one nucleic acid sample comprising cobtaining the sample from one or more individuals and determining the nucleic acid sequence at one or more polymorphic positions in a gene encoding a protein selected from the group above; (3) constructing (M2) an individual at risk of developing a disorder CC upon administration of an ACE inhibitor and/or vasopeptidase inhibitor comprises one or more polymorphic positions within a gene encoding a protein selected from the group above; (3) constructing (M2) human protein selected from the group above; (3) constructing (M2) comprises one or more polymorphic positions within a gene encoding a disorder comprises one or more polymorphic positions and (6) genotyping (M4) an individual activity and (6) genotyping (M4) an cleic acid sample, determining the comprises one position with a known data set. The genes, (M1, M2, M3 and M4) and compositions are useful for detecting, diagnosing, treating, corporating various disorders such as angioedasma and diseases which a composition, heart failure, myocardial infarction, ventricular compositions, tractions, sarcomas, Crohn's composition, beart failure, myocardial infarction, ventricular compositions, sarcomas, cronary compositions, sarcomas, compositions, and compositions, sarcomas, compositions, and compositions, sarcomas, compos
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        autoimmune disease; inflammatory arthritis; cancer; wound; viral infection; bacterial infection; fungal infection; COPD; Chronic obstructive pulmonary disease; enterocolitis.
                                                           polynucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence is included in the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated nucleic acid from a human encoding aminopeptidase P (XPNEP2), bradykinin receptor B1 (BD)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; Page 709; 977pp; English

encoding aminopeptidase P (XRMEP2), bradykinin receptor B1 (BDKRB1), C1 esterase inhibitor (C1NH), kallikrein CC 1 (KLK1), bradykinin receptor B2 (BDKRB2), angiotensin converting enzyme CC 2 (ACE2) or protease inhibitor 4 (PI4), comprising at least one CC polymorphic position. Also included are (1) a probe that hybridises to a CC polymorphic position as provided in the detailed summary of single CC nucleotide polymorphisms comprising additional 5' and 3' flanking genomic CC sequence; (2) analysing (M1) at least one nucleic acid sample comprising CC obtaining the sample from one or more individuals and determining the compactions in a gene CC encoding a protein selected from the group above; (3) constructing (M2) constructing (M3) an individual at risk of developing a disorder CC (4) identifying (M3) an individual at risk of developing a disorder CC upon administration of an ACE inhibitor and/or vasopeptidase inhibitor

Drug compositions containing expression vector for an immunosuppressive cytokine gene or soluble cytokine receptor gene for treatment of tumors and inflammatory disorders.

Page 8; 44pp; Japanese.

The invention relates to drug and inflammatory disorders in cytokine gene or compositions for the treatment of tumours the form of an expression vector for an ne or soluble cytokine receptor gene. The

sequences are useful for treating or preventing a MOIX-associated disorder, such as cardiomyopathy, atherosclerosis, disorders related to cell signal processing and metabolic pathway modulation, diabetes and cancer. Additionally, MOIX proteins and coding sequences are useful for preventing and treating a variety of disorders including metabolic disorders, nutritional oedema, chronic and hereditary pancreatitis, obesity, infectious disease, anorexia, neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, stroke, immune disorders, haematopoietic disorders and various dyslipidaemias, metabolic syndrome X and wasting disorders associated with chronic diseases and cancers, cardiac disorders, hypertension, hypercalcaemia, cirrhosis, angiogenesis and wound healing, trauma, glomerulonephritis, hyper and hypothyroidism, multiple sclerosis, lung diseases including asthma, Crohn's disease, seleroderma, autoimmune diseases, developmental disorders and neural tube
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             26-APR-2000;

                                                                                                                                                                                                                                                     The invention relates to modulating the production of interferon (IFN)-gamma in a CD8plus+ cell. The method involves contacting a CD8+ T cell with an agent that modulates the expression and/or activity of T-bet. The present sequence represents a RT-PCR primer used in real time quantification of IFN-gamma transcripts

                                                                                                                                                                                                                   a microarray of polynucleotides or polypeptides, and selecting polynucleotides or polypeptides that predict the sensitivity or resistance of cells associated with a disease state by using the expression pattern of the microarray. The polynucleotides and polypeptides have cytostatic activities, and can be used in gene therapy. The polynucleotides and polypeptides are useful in predicting the activity of compounds that interact with protein tyrosine kinases and/or protein tyrosine kinase pathways. These may be used in determining drug sensitivity in patients to allow the development of individualized genetic profiles which aid in treating diseases and disorders (e.g. cancer) based on patient response at a molecular level. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                Sequence 21 BP; 4 A; 3 C; 9 G; 5 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New polynucleotides and polypeptides for predicting the activity of compounds that interact with protein tyrosine kinases and/or protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                31-JUL-2003

                                                                                                                                                                                                                                                               resistance of cells associated with a disease state by using the expression pattern of the microarray. The polynucleotides and polypeptides have cytostatic activities, and can be used in gene therapy. The polynucleotides and polypeptides are useful in predicting the activity of compounds that interact with protein tyrosine kinases and/or protein tyrosine kinase pathways. These may be used in determining drug sensitivity in partients to allow the development of individualized genetic profiles which aid in treating diseases and disorders (e.g. cancer) based on patient response at a molecular level. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               modulating the activity of cells, comprising obtaining a sample of cells, determining whether the cells express a plurality of markers, and correlating the expression of the markers to the compound's ability to modulate the activity of the cells; (2) a plurality of cell lines for identifying polynucleotides and polypeptides whose expression levels correlate with compound sensitivity or resistance of cells associated with a disease state; and (3) identifying polynucleotides and polypeptides that predict compound sensitivity or resistance of cells associated with a disease state, comprising subjecting the plurality of cell lines to one or more compounds, analysing the expression pattern of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     a microarray of polynucleotides or polypeptides, and selecting polynucleotides or polypeptides that predict the sensitivity or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a method for preparing maize with improved digestibility or altered lignin composition. The method involusing a nucleotide sequence which modulates synthesis of maize caffeic acid 3-0-methyltransferase (COMT), encoded by ACC00262. The maize produced by the method of the invention is useful as animal fodder. The present PCR primer was used in the construction of COMT transformation vectors which were used in an example from the invention

The DNA and protein sequences of the invention are useful for treating or preventing a MOL-associated disorder, such as: cardiomyopathy, atherosclerosis, disorders associated with cell signal processing and metabolic pathway modulation, or diabetes. The DNA and protein sequences are also useful for the treatment of: cancer, stroke, Huntington's disease, epilepsy, anxiety, pain, hypercholesterolaemia, obesity, hypertension, Crohn's disease, systemic lugus erythematosus, viral infections, bacterial infections, parasitic infections, hyperthyroidism, hypothyroidism, Von Hippel-Lindau syndrome, Alzheimer's disease, tuberous sclerosis, hypercalcaemia, or cerebral paley. The present DNA sequence was used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 21 BP; 3 A; 5 C; 6 G; 7 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New MOLX polypeptides and polynucleotides, useful in gene therapy, particularly for treating or preventing e.g. cardiomyopathy, atherosclerosis, diabetes, adenoma, brain tumor, breast cancer, prostate cancer, stroke or pain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          18-JUN-2001; 2001US-0298994P.

Specifically, it refers to a high throughput method for the parallel analysis of many potential sites of chemical modification (e.g. methylation) in DNA. The present invention describes treating the DNA with one or more chemical reagents that result in different base sequences depending upon the presence or absence of the modification of interest. Accordingly, a device comprising an array of probes is provided to hybridise with and select the altered DNA sequences that comprise the modifications of interest such as a CpG island. In particular, this invention refers to analysing the methylation pattern of a region of the promoter for the tumour suppressor gene pl6 from two human lung tumour cell lines H69 and H1618. This oligonucleotide sequence is a human DNA probe used to immobilise CpG methylated DNA of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                ethnic origin determination; polymorphic site determination; Y chromosome; paternity testing; forensic; diagnosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                NRY polymorphism detection primer #290.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      03-JUN-2004

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes a method of determining the ethnic origin of a comprising obtaining a nucleic acid sample from the male, and identifying at least two polymorphic markers in the nucleic acid sample ci identifying at least two polymorphic markers in the nucleic acid sample indicative of the ethnic origin of the male, using at least one primer pairs given in the specification. Also described is a method of: identifying polymorphic sites in a nucleic acid; a kit for determining the ethnic origin of an individual; determining the ethnic origin of an individual; determining the ethnic origin of an isolated nucleic acid segment of a human y chromosome comprising at least 10 contiguous bases including at least 10 contiguous bases including at least none of the polymorphic sites given in the specification; nucleic acid primer pairs for amplifying polymorphic regions of the y chromosome comprising at least 10 contiguous bases including at least 10 contiguous bases including at least one of the polymorphic sites given in the specification; nucleic acid primer pairs for amplifying polymorphic regions of the y chromosome comprises the paternity of a human male condition. The method is useful for determining the ethnic origin of a midividual. The method is useful for determining the ethnic origin of a condition. This sequence represents a primer used to detect polymorphisms in the non-type.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

The invention describes a method of determining the ethnic origin of a male comprising obtaining a nucleic acid sample from the male, and identifying at least two polymorphic markers in the nucleic acid sample indicative of the ethnic origin of the male, using at least one primer pair from the primer pairs given in the specification. Also described is a method of: identifying polymorphic sites in a nucleic acid; a kit for determining the ethnic origin of an individual; determining the ethnic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC The invention describes a method of determining the ethnic origin of a CC male comprising obtaining a nucleic acid sample from the male, and conditiving at least two polymorphic markers in the nucleic acid sample CC indicative of the ethnic origin of the male, using at least one primer CC pair from the primer pairs given in the specification. Also described is CC a method of: identifying polymorphic sites in a nucleic acid, a kit for CC determining the ethnic origin of an individual; determining the ethnic CC origin of a human male individual; an isolated nucleic acid segment of a human Y chromosome comprising at least 10 contiguous bases including at CC least one of the polymorphic sites given in the specification; nucleic CC acid primer pairs for amplifying polymorphic regions of the Y chromosome CC individual. The method is useful for determining the ethnic origin of a cC male, for paternity testing, for forensic studies or for diagnosis. This sequence represents a fragment of the non-recombining region of the human CC Y chromosome (NRY) comprising a polymorphism that can be used to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ફ
               The invention describes a method of determining the ethnic origin of a comprising obtaining a nucleic acid sample from the male, and identifying at least two polymorphic markers in the nucleic acid sample indicative of the ethnic origin of the male, using at least one primer pair from the primer pairs given in the specification. Also described is a method of: identifying polymorphic sites in a nucleic acid; a kit for determining the ethnic origin of an individual; determining the ethnic origin of an individual; acid segment of a human wale individual; an isolated nucleic acid segment of a corigin of a human male individual; an isolated nucleic acid segment of a least one of the polymorphic sites given in the specification; nucleic acid primer pairs for amplifying polymorphic regions of the Y chromosome given in the specification; and determining the paternity of a human male individual. The method is useful for determining the ethnic origin of a male, for paternity testing, for forensic studies or for diagnosis. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

The method is useful for determining the ethnic origin of a male, for paternity testing, for forensic studies or for diagnosis. This sequence represents a primer used to detect polymorphisms in the non-recombining region of the human Y chromosome (NRY).
                                                                                                                                                                                                                                                                                                                                                                       Determining the ethnic origin of a male by obtaining a nucleic acid sample from the male and identifying at least two polymorphic markers the nucleic acid sample indicative of the ethnic origin of the male.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Oefner PJ, Underhill PA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Homo sapiens

The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                      Novel human polypeptide MOL3 PCR primer #1.

                                                                                                                                                                 CC polypeptide, MOLX nucleic and antibody are useful for treating,
CC preventing or alleviating a MOLX-associated disorder or a pathological
CC state in a subject, particularly a human. In particular, the disorder is
CC cardiomyopathy, atherosclerosis, diabetes, or a disorder related to cell
CC signal processing and metabolic pathway modulation. The MOLX polypeptide
CC and nucleic acid are also useful for diagnosing the presence of or
CC predisposition to a disease associated with altered levels of MOLX.
CC particularly cancer. The MOLX nucleic acid and polypeptide are especially
CC useful in the manufacture of a medicament for therapeutic or prophylactic
CC applications for disorders associated with aberrant MOLX expression or
CC tuberous sclerosis, hypercalcemia, Parkinson's disease, Huntington's
CC disease, cerebral palsy, epilepsy, Leech-Nyhan syndrome, multiple
CC disease, cerebral palsy, epilepsy, Leech-Nyhan syndrome, multiple
CC depression, pain, obseity, Crohn's disease, osteoporosis, inflammatory
CC bowel disease, infertility, hypertension, scleroderma, hemophilia,
CC pancreatitis, autoimmune disease, asthma, arthritis, immunodeficiencies,
CC HIV, viral, fungal, bacterial or protozoal infections, or graft-versus-
CC tisease, the DNA encoding the protein is useful in gene therapy for
CC treating the above conditions. This sequence represents a primer used in
CC the isolation of DNA encoding a novel human MOLX polypeptide.

The sequence of the invention has sequence homology to rat myotonic dystrophy kinase-related Cdc42 binding kinase (MRCK). The invention may be useful for diagnosing, prognosing, and treating kinase-related diseases, preferably diseases associated with aberrant expression of MRCKI. The present sequence is that of a short inhibitory (siRNA) sequence which is targeted towards the human MRCKI gene and which is related to the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                       (AMHP) WYETH.

```

This invention relates to nucleic acid sequence, the and the novel human protein

to a novel isolated polynucleotide comprising the human MRCK1 gene located at position 11q1: otein kinase MRCK1 encoded by it. The sequence

at position 11q13, it. The sequence c

The invention may be useful for diagnosing, prognosing, and treating kinase-related diseases, preferably diseases associated with aberrant expression of MRCKI. The present sequence is that of a DNA sequence which is part of the human MRCKI gene which may be a target for a short inhibitory (siRNA) sequence and which is related to the invention. Note: The sequence data for this pattent did not form part of the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                          This invention relates to a novel isolated polynucleotide comprising a nucleic acid sequence, the human MRCKI gene located at position 11q13, and the novel human protein kinase MRCKI encoded by it. The sequence of the invention has sequence homology to rat myotonic dystrophy kinase-related Cdc42 binding kinase (MRCK). The invention may be useful for diagnosing, prognosing, and treating kinase-related diseases, preferably diseases associated with aberrant expression of MRCKI. The present sequence is that of a short inhibitory (siRNA) sequence which is targeted towards the human MRCKI gene and which is related to the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure; SEQ ID NO 92; 92pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New human protein kinase MRCK1 with 65% sequence homology to dystrophy kinase-related Cdc42-binding kinase (MRCK), useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 2004-461109/43.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WO2004050831-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               protein kinase; MRCK1; myotonic dystrophy kinase; Cdc42 binding kinase; MRCK; kinase-related disease; short inhibitory RNA; siRNA; human; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human MRCK1 sense strand siRNA sequence SeqID92.

                                                                                                                                This invention relates to a novel isolated polynucleotide comprising a nucleic acid sequence, the human MRCKI gene located at position 11q13, and the novel human protein kinase MRCKI encoded by it. The sequence of the invention has sequence homology to rat myotonic dystrophy kinase related Cdc42 binding kinase (MRCK). The invention may be useful for disposing, prognosing, and treating kinase-related diseases, preferably diseases associated with aberrant expression of MRCKI. The present sequence is that of a DNA sequence which is part of the human MRCKI gene which may be a target for a short inhibitory (siRNA) sequence and which is related to the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The sequence of the invention has sequence homology to rat myotonic dystrophy kinase-related Cdc42 binding kinase (MRCK). The invention may be useful for diagnosing, prognosing, and treating kinase-related diseases, preferably diseases associated with aberrant expression of MRCKI. The present sequence is that of a DNA sequence which is part of the human MRCKI gene which may be a target for a short inhibitory (siRNA) sequence and which is related to the invention. Note: The sequence data for this pattent did not form part of the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New human protein kinase MRCK1 with 65% sequence homology to dystrophy kinase-related Cdc42-binding kinase (MRCK), useful diagnostics and as a drug target.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (AMHP) WYETH.

                                                                                                                                                                                     sequences (AAQ52824-Q52890) are pref. Cytomegalovirus target sequences for enzymatic RNA molecules. The RNA molecules are complementary to a substrate binding region in the specified gene target. They also have enzymatic activity, in that they specifically cleave RNA in the target. The ERMs interfere with viral replication and therefore have anti-viral properties. They can be used to attenuate viruses to be used in vaccines. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                          Claim
                                                                                                                                                                                                                                                                                                                                                                                                        Enzymatic RNA molecules
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Draper
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              25-NOV-1993

A sample of 371 DNA sequence fragments were determined and of these, 277 were suitable for STS primer prediction by computer analysis (using the "primer" program available from E.Lander, MIT). The STSs and cosmids were mapped by in situ hybridisation, somatic cell hybrid analysis or both. Using this method, 370 STSs specific for human chromosome 11 were generated and most of them were regionally mapped. This procedure illustrates a novel method for sequencing complex genomes designated "sequence sampled mapping". The sequence sampled mapping method is useful for the completion of high density sequence-based maps, and ultimately, for the complete sequencing of genomic DNA directly from cosmid clones. See AAQ82001-082706 for STS primers. (Also see AAQ91325-58). (Updated on 25-MARR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequencing complex genomes, present as fragments in a cosmid library -sequencing end-specific nucleotides of each clone then correlating with spatial relationship of cosmid, esp. for mammalian chromosomes.
                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example 4; Page 79; 128pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                               AAV51705-V52008 are reverse PCR primers used to amplify fragments of the Zea mays genome in order to detect polymorphic markers. Such markers can be used in the construction of allele-specific primers and probes for amplification or hybridisation, e.g. to determine common or disparate ancestry between 2 or more plants, to monitor the genetic contribution of an ancestral plant, to trace the progeny of proprietary plants, in certification of a hybrid plant or to identify the progeny of a back-crossed plant with an ancestral plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polymorphic marker; allele-specific; probe; amplification; PCR primer; hybridisation; plant; hybrid certification; genetic contribution; progeny; back-cross; hybrid; ancestry; corn; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAX09121-X10268 are allele-specific oligonucleotide primers used in the Claiman of various biallelic polymorphic markers found in the human genome (represented in AAX10269-X12937). These primers can be used in a comment of determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial properties of the polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, Ehlers-Danlos syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid counted may be a seed to produce medicaments for the trarent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     members of a family of transcriptional regulator genes containing a bromodomain (BAZ, Bromodomain with Atypical Zinc finger) which are expressed specifically in testis tissue and also in certain tumour l Transgenic cells may be used for the preparation of the BAZ1-alpha, beta, BAZ2-alpha and BAZ2-beta proteins. These proteins can be used the treatment of cancer and other proliferative disorders, and in screening of compounds for their binding ability to the expression products (e.g. for use as drugs by modulation of transcriptional regularion).
The present invention describe a method for detecting target hepatitis Gravirus (HGBV) nucleic acid (THN) in a test sample (T) suspected of containing HGBV. The method involves reacting (T) with a HGBV polynucleotide probe (I) containing 15 contiguous nucleotides, and which selectively hybridises to the HGBV genome or its full complement, and detecting the complex that contains THN, indicating the presence of
                                                                                                                   Detecting target hepatitis GB virus nucleic acid in a test sample suspected of containing HGBV comprises reacting the test sample the polynucleotide probe and detecting the complex that contains target

                                                                           PCR primers AAA15054-55 were used to produce deletion mutants of the invasin protein TpaC. The specification describes a method for the production of recombinant invasin proteins which are superior to presently approved adjuvants due to their low toxicity, their ability to stimulate both peripherals and mucosal immune response, and ease of production. The invasin protein may be used as a vaccine and as an adjuvant for the prevention of diseases such as shigellosis, salmonellosis and diseases caused by enteroinvasive E. coli, and in stimulating the immune system of immuno-compromised individuals. The invasin protein is also useful for intracellular delivery of therapeutic and diagnostic agents, and to stimulate immune response by cells in the object of the stimulation of the invasin protein can be mixed with antigens of biological or other invasin protein can be mixed with antigens of biological or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Invasin protein; IpaC; mucosal limiune ever coli; immune system shigellosis; salmonellosis; enteroinvasive E. coli; immune system immuno-compromised; intracellular delivery; antigen; PCR primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         target HGBV. The method is used for detecting target HGBV nucleic acid in the test sample suspected of containing HGBV and for characterisation of newly ascertained etiological agent onor-A, non-B, non-C, non-D and non-E hepatitis causing agents collectively termed as hepatitis GB virus.

AAA55270 to AAA55489 and AAB08985 to AAB09480 represent nucleotide and protein sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New purified recombinant invasin proteins adjuvant and vaccine against shigellosis, enteroinvasive Escherichia coli.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           21-OCT-1998;

PCR primers AAA96313-15 were used to amplify cDNA encoding a secreted or transmembrane polypeptide. The specification describes polypeptides designated pRO1484, PRO4334, PRO1122, PRO1889, PRO1890, PRO1891, PRO1785, PRO4351, PRO4357, PRO4405, PRO4356, PRO4352, PRO4380, PRO4354, PRO4408, PRO5737, PRO4425, PRO5990, PRO6030, PRO4424, PRO4422, PRO4410 and PRO4499. PRO1889 polypeptide is useful for diagnosing tumour in a mammal. The polypeptides, their agonists and antagonists are useful treating a condition associated with expression or activity of the polypeptide.

Score 14.4;

insulinemia. The polypeptides are capable of inducing proliferation of
mammalian kidney mesangial cells and are therefore useful for treating
kidney disorders associated with decreased mesangial cell function such
as Bergers disease or other nephropathies associated with Schonlein-
Henoch purpura, celiac disease, dermatitis herpetiformis or Crohns
disease. The nucleic acids may be used to generate transgenic animals for
use in development and screening of therapeutically useful reagents and
also for chromosome identification and tissue typing
                                                                                                                                                                                                               Sequence 22
                                                                                                                                                                                                                                                                                        The invention relates to a method for preparing Ni-containing superoxide dismutase (NISOD) from Streptomyces coelicolor or Streptomyces lividans. The invention also discloses a method for producing a strain of Streptomyces lividans in which the gene encoding NiSOD (sodN) is deleted. Sequences ADK68393-ADK68394 represent PCR primers used to amplify a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI; 2000-547509/50.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Streptomyces
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Superoxide dismutase; nickel-containing; NiSOD; sodN; orfX; preparation; Streptomyces coelicolor; Streptomyces lividans; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nickel-containing superoxide dismutase (NiSOD)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       06-MAY-2004
                                                                                                                                                                                                                                                                 Streptomyces sodN gene in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Kim EJ,

The method is useful in gene therapy of telomere length-related diseases such as melanoma, liver cancer, breast cancer, bladder cancer and brain cancer. The present sequence is that of a Mrell related PCR primer of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to control of telomere length in a cell by modifying the physiological activity of the Mrell protein in the cell, by transformation of the cell with DAA encoding a foreign Mrell protein which may be modified in the C-terminal and/or nuclease domain. The method is useful in gene therapy of telomere length-related diseases such as melanoma, liver cancer, breast cancer, bladder cancer and brain
                                                                                                                                                                                                                                   SNPE; genotyping; agammaglobulinaemia; ulaueues illustrolesterolaemia; lesch-Nyhan syndrome; muscular dystrophy; familial hypercholesterolaemia; polycystic kidney disease; osteogenesis imperfecta; autoimmune disease; polycystic kidney disease; osteogenesis imperfecta; multiple sclerosis; acute intermittent porphyria; rheumatoid arthritis; multiple sclerosis; acute intermitty analysis; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 22
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cancer. The present sequence is that of a Mrell related PCR primer of the invention. Note: The present sequence is given as SEQ ID NO 10 in the disclosure but differs from that given as SEQ ID NO 10 in the sequence listing (AAH75566) and is identical to that given as SEQ ID NO 12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Controlling telomere length for gene therapy of telomere length related tumors comprises transformation using the modified Mrell protein.

CC SNP flanking sequence, the SNPE primer is used as a genotyping primer.

CC The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence or coligonucleotides are useful for determining the presence or coligonucleotides and for genotype of an individual or group of individuals, having a pathological phenotypic traits include diseases e.g. compared to superior traits include diseases e.g. coligonucleotides insipidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hyperrcholesterolaemia, polycystic kidney disease, coligonus include symptoms of or susceptibility to multifactorial corresponsis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial confidences, including, rheumatoid arthritis, multiple sclerosis, confidences, including, rheumatoid arthritis, multiple sclerosis, and compared to the present sequence represents a PCR primer specific paternity analysis. The present sequence represents a PCR primer specific confidences in the present sequence represents a PCR primer specific confidences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using to oligonucleotides of the invention. The PCR primers are used to amplify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     acid sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nuc
                                                                for a human SNP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ត្តត្តត្តត្តន្ត¥&
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ś
                                                            The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in clones of the genomic libraries contained in clones of the genomic libraries contained in clone contained in each of the multiwell plates; (b) a primer designed based on the chromosome marker contained is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to the multiwell containing the clones in the multiwell plates of the specified conditaters; (e) the clones in the multiwell plates of the specified conditateral directions; (f) the mixed clones are contained and the cresultant cultures are amplified by using the above primer; (g) signals are detected from the amplified by using the above primer; (g) signals care detected from the amplified producte; (h) the clones in the multiwell plates are specified constituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABI42957 to ABI45322 represent pcr primers for human chromosome 21422.1, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

The invention also comprises a microbe which has been transformed with the gene encoding the iron-binding aerotolerant protein. The microbe of the invention is useful in the preparation of milks of long appreciation period. The present nucleotide sequence represents an S. mutans iron-binding aerotolerant protein-related oligonucleotide (dpr1)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 4; Page 51; 528pp; Japanese.

CC The polymorphisms in the human genes cited in the invention are useful as C genetic linkage markers for locating and characterising the genes that C are responsible for specific traits within the genome and eventually CC identifying the genes responsible for a variety of disorder-related C traits as a result of their e.g., overexpression, constitutive c expression, mutation or underexpression, which may be used in diagnosing CC and/or treating the disorders. The nucleic acid molecules comprising the colymorphic sequences contained in CYP4501A1, CYP4501A2, CYP4502E1, CC ARNT, EPHX2, GST12, NNMT, NQO2, NR112, STM, UGT2B4, UGT2B15, AHR, CC MDR1 and/or MDR3 are useful for screening individuals for altered drug C susceptibility to cancer. Polymorphic sequences in individuals for altered central consecution in the prostate, in DBI or CHMR1 for altered central consecution system function, in FLAP and HNMT for altered mununological or haematological function. The present sequence central and CC peribheral nextous system function, in CHMR3 for altered central and constant of the prostate, in LTF for altered immunological or peribheral nextous, in CHMR3, The present sequence central and CC peribheral nextous, in CHMR3, The present sequence central and constants as a constant of the constant sequence central and constants as a constant sequence central and constants as a constant sequence central central constants and cons
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a new isolated nucleic acid which encodes a PRO polypeptide. The methods and compositions of the present invention are useful for the diagnosis and treatment of disorders associated with the PRO polypeptides, such as diabetes, obesity and hypoinsulinaemia. The present sequence represents a human secreted and transmembrane PRO

The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides and polynucleotides are useful in diagnosing or treating notins in dependent diabetes mellitus, cancers, septic shock, rheumatoid arthritis, graft-versus-host disease, stroke, cardiac ischaemia, psoriasis, inflammatory bowel disease or asthma. The PRO polynucleotide sequences may be used as hybridisation probes in chromosome and gene mapping, or in generating antisense RNA and DNA. They are also useful in preparing PRO polypeptides, in assays to identify other proteins or molecules involved in binding reaction, to generate transgenic animals c

The PRO polypeptides and nucleic acid molecules are also useful in gene therapy, and as molecular weight markers for protein electrophoresis purposes. Anti-PRO antibodies may be used in diagnostic assays for PRO polypeptides, or for the affinity purification of the polypeptides from recombinant cell culture or natural sources. The present sequence represents a PCR primer used in the examples of the present invention

                                                                                                                                                                                                                                                                                        as PRO,
cardiac
                                                                                    The invention relates to an isolated nucleic acid that encodes a PRO polypeptide. The nucleic acids and polypeptides are useful for treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, acquired immunodeficiency syndrome (AIDS), cancer, differentiation disorders, cell adhesin disorders, neural receptor disorders, skin disorders or diabetic complications. The nucleic acids are useful as hybridisation probes, in chromosome and gene mapping and in generating antisense RNA or DNA. The polypeptides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. Both are useful in tissue typing. The present sequence represents a PCR primer used to isolate a cDNA encoding a PRO polypeptide.
                                                                                                                                                                                                                                                                                                                     New

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a protein array comprising a surface upon CC which at least two protein moleties are deposited at spatially defined CC locations, where the protein moleties are naturally occurring variants of CC a DNA sequence of interest. Also described: (1) making a protein array; CC (2) screening a set of protein moleties for molecules that interact with CC once or more proteins; and (3) simultaneously determining the relative CC properties of members of a set of protein moleties. The protein array can be used for determining the phenotype of a naturally occurring variant of CC a DNA sequence of interest. The protein array is useful for drug CC discovery, pharmacogenomics and diagnostics. The protein array allows the parallel analysis of closely related proteins with a sensitivity that is CC volumes of potentially expensive ligands, and in a quantitative, CC comparative functional analysis manner not previously possible. ACF06000 CC comparative functional analysis manner not previously possible. ACF06000 CC exemplification of the present invention

Desnoyers L, Watanabe Eaton n DL, Goddard A, (, Wood WI, Godowski PJ, Zhang Z; Gurney Pan

2003-615764/58.

Novel isolated secreted and transmembrane polypeptides, designated as polypeptides e.g. PRO1484, PRO4334 and PRO1122, useful for inhibiting tumor cell growth, and for preparing medicaments for therapeutic use. les e.g. F PRO

Example 9; Page 85; 201pp; English.

The invention describes an isolated secreted and transmembrane PRO CC polypeptide (I), having at least 80% identity to or scoring at least 80% compositives when compared to, a sequence (SI) comprising 246, 440, 197, 97, CC 273, 571, 209, 888, 502, 310, 251, 800, 507, 248, 223, 134, 136, 468, CC specification. An anti-(I)-antibody is useful for determining the CC presence of (I) in a cell. (I) is useful for identifying a compound CC capable of inhibiting the expression and/or activity of (I). (I) and the CC antibody are useful for inhibiting the growth of tumour cells, and for CC the preparation of a medicament useful in the treatment of a condition CC which is responsive to (I) or the antibody. A polynucleotide (II) CC encoding (I) is also useful for isolating full-length PRO cDNA for CC exceuseful in the development in the screening of therapeutically useful creagents, and in gene therapy. PRO is useful in assays to identify other CC proteins or molecules involved in binding interactions, for screening chemical libraries. (I) is useful as molecular weight marker for protein contributions or agonists of binding interactions and for screening chemical contributions or agonists of bareapeutic agents. (I) or (II) is useful for characteristics and in the contribution of the contribution of the contribution of a screening chemical contributions or agonists of bareapeutic agents. (I) or (II) is useful for characteristics and for protein contributions or contributions tissue typing and for chromosome identification. is useful

```
The invention relates to an isolated, secreted and transmembrane CC polypeptide, termed PRO polypeptide, PRO having at least 80 % sequence CC identity to any one of the 23 100-900 residue amino acid sequences, given in the specification or to a sequence encoded by a nucleic acid molecule composited under any one of the ATCC accession numbers given in the specification. Also included are an isolated nucleic acid molecule having CC at least 80 % sequence identity to any one of 23 400-3500 nucleotide sequences given in the specification, (or a nucleotide sequence encoding PRO, a full-length PRO codding sequence, a full-length codding sequence of CC DNA deposited under any ATCC accession number given in the specification) or at least 80 % identity to a nucleotide sequence encoding PRO, lacking CC in the associated signal peptide, a sequence encoding PRO, lacking CC pRO, a chimeric molecule comprising PRO fused to a vector comprising CC PRO, a chimeric molecule comprising PRO fused to a heterologous amino CC acid sequence and an anti-PRO antibody. PRO is useful for identifying ant/agonists or antagonists of PRO, preparing a variant of PRO, as markers. PRO is also useful as therapeutic agent. PRO is cuseful in assays to identify molecules or proteins which bind to PRO and CC useful in assays to identify molecules or proteins which bind to PRO and CC antisense RNA and DNA, for generating transgenic animals or knockout canimals which in turn are useful in the development and screening of therapeutically useful reacents. PRO nucleic acid is also useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   01-DEC-2000; 2000WO-US032678.

                                                                                                              therapeutically useful reagents. PRO nucleic acid is also useful in mapping the gene which encodes the PRO and for the genetic analysis of individuals with genetic disorders, in gene therapy, for chromosome identification, as chromosome marker, and for generating probes for PCR, Northern analysis, Southern analysis and Western analysis. The antibody useful in diagnostic assays for PRO, for affinity purification of PRO, and for treating septic shock. PRO or the antibody is useful for the preparation of medicament for treating conditions which is responsive to the PRO polypeptide or anti-PRO antibody. PRO and PRO nucleic acid are useful for treating triang is a proper lead in the property is an extensive to the property is an 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Desnoyers L
